

Gate C: source validation and staged release

Progress report, system-test record and show-and-tell

Evidence field	Recorded value
Status	Final - subject to review sign-off by exception
Delivery scope	A-002 validation and staging slice; Gate C remains active
Walkthrough	3 September 2026, local synthetic Minikube environment
Published implementation	292f56538a4272b2122cf17fbbb15ef7ca3b4dbd
Deployed build provenance	30acae4c340b09111d1c22cb720ac2186bc7a117+working- tree candidate
Runtime image and digest	development; sha256:37bbdbbe1a397270d97f2b9f1352ade3e4335b1915be589a6d98deefc671be79
Exact-source hosted check	Run 33739198538; successful for published implementation
Environment, cluster and trust	environment-c5ef1307484826d1b598ad73a08d31b6; public-purpose-lab-gate-a; local synthetic root

This is synthetic, in-development demonstrator evidence. It does not establish production, legal, regulatory, clinical, evidence-quality, malware-clearance or compliance assurance, and it does not transfer accountable human authority to the Lab.

Outcome

The approved A-002 slice now makes source validation and release to staging visible as a real, component-owned business path. A named synthetic reviewer can submit reviewed text, see an immutable source version quarantined, inspect five deterministic checks, and request staging. CNT-01 obtains an exact protected-action decision from the separately deployed AUT-01, records the outcome and emits metadata-only lifecycle facts. Operations displays the successful and refused paths under the same Demonstration Session.

This report corrects the missing evidence pack for the already published implementation. The validated runtime image was deliberately reused: the correction changes documentation and evidence, not the walked behaviour, presentation, contracts or security boundary. Rebuilding would create a new fingerprint without adding assurance. The table records both the image's actual candidate-build label and digest and the implementation revision into which that candidate was published.

The evidence session was session:581f41af-e0b8-4fde-a744-5246bbda1c2b. It was stopped and reset to clean successor session:7cdb6638-18dc-4de0-b1e1-8fa34f2155d4 after capture.

Acceptance summary

Approved flow requirement	Walkthrough evidence	Position
Director requests the target-owned source-intake view	Figure 1	Achieved
Reviewer sees content and provenance before submission	Figure 2	Achieved
CNT - 01 quarantines one immutable version	Figure 3	Achieved
Five bounded validation checks are visible	Figures 3 and 4	Achieved
Named reviewer requests an exact AUT - 01 decision	Figure 4	Achieved
Lifecycle facts are correlated and content-free	Figure 5	Achieved
Hostile-marker validation fails closed	Figures 5 and 6	Achieved
Twelve shared component instances remain ready	Figure 7; inherited Gate A	Achieved
KNO - 01 processing begins only in the next slice	Explicit limitation	Pending

Walkthrough flow

1. Director starts the governed path

The Director ran the admitted synthetic scenario and requested WB - SOURCE - INTAKE through the event path. The semantic command changes the target view only; it does not claim source receipt, validation or staging.

Figure 1. Running Demonstration Session after the Director requested the Workbench source-intake view through a semantic event.

2. Reviewer checks the source before submission

Workbench showed paste mode, media type, byte count, preview, title, owner, rights and provenance before any business submission. The reviewer explicitly confirmed that the fixture was synthetic. Remote retrieval remained disabled.

The screenshot displays a web form for submitting synthetic data. The form is organized into several sections:

- Upload a small text or Markdown file:** Includes a "Choose file" button and the text "No file chosen".
- Link a source - later Gate C slice:** Includes a text input field with the value "Remote retrieval is deliberate".
- Or paste synthetic text:** Includes a text area with the text "Synthetic Harbour Community Support winter policy. Staff may offer a warm-space referral to synthetic residents after a human reviewer confirms the current local guidance and...".
- Title:** Includes a text input field with the value "Synthetic winter support poli".
- Source owner:** Includes a text input field with the value "Harbour Community Support".
- Rights:** Includes a text input field with the value "Synthetic demonstration fixt".
- Provenance:** Includes a text area with the text "Created by Public Purpose Lab for the Gate C synthetic walkthrough".

Below these fields is a **Submission preview** section:

- It shows "Pasted text · text/plain · 236 bytes".
- It displays a truncated preview of the synthetic text: "Synthetic Harbour Community Support winter policy. Staff may offer a warm-space referral to synthetic residents after a human reviewer confirms the current local guidance and recor...".
- There is a checkbox labeled "I confirm this source contains synthetic demonstration data only." which is checked.
- A prominent green button labeled "Submit to quarantine" is present.
- Below the button, a note states: "Submission creates a quarantined, immutable first version and metadata-only lifecycle events. It does not approve or process the source."

At the bottom of the form, a light green box contains the text: "wb-source-intake resolved by the Workbench. This records presentation progress only."

Figure 2. Synthetic source, provenance and classification reviewed before the enabled quarantine command.

3. Quarantine and deterministic validation

CNT-01 recorded immutable version `source-version:89696780-529b-4d22-937f-45376d16431c`. Workbench returned status and metadata without returning the body. Media type, content presence, digest, text-control and hostile-marker checks all passed, leaving the version eligible for a reviewer-controlled staging request.

WB-SOURCE-STATUS

Source validation and controlled staging

The source remains isolated from knowledge processing until its deterministic checks pass and this reviewer requests an AUT-01 policy decision. Human authority is unchanged.

Intake status quarantined	Lifecycle status validated	Version 1	Source version source-version:89696780-529b-4d22-937f-45376d16431c
Actor synthetic-reviewer	Digest fe079e905fd63dc1f38ff09938902cebb70df6c9e330beefdd25fa51fe0f78e9	Correlation session:581f41af-e0b8-4fde-a744-5246bbda1c2b	

Bounded validation checks

- media-type-supported: **passed**
- content-present: **passed**
- digest-matches: **passed**
- text-controls-safe: **passed**

Figure 3. Quarantined immutable version with actor, digest, correlation and visible conclusive validation results.

4. Reviewer-controlled release through AUT - 01

The synthetic reviewer requested release of the exact validated version. AUT - 01 permitted that actor, role, purpose, action and resource combination; CNT - 01 then recorded staged with policy decision decision-724183b429b860f2. Staging is not approval of a finding or report.

Figure 4. Staged lifecycle state, named reviewer and retained AUT-01 policy-decision reference.

5. Correlated operational facts

Operations showed source .received, source .quarantined, source .validated and source .staged for the successful version. It also showed receipt, quarantine and source .validation -refused for the adverse fixture. The events expose identifiers, action and outcome, not source content.

Figure 5. CNT-01 timeline showing the complete successful lifecycle and the separate validation-refused path.

6. Adverse input fails closed

A second synthetic fixture contained a disclosed hostile marker. Its immutable version remained quarantined, the hostile-markers-absent check failed with safe reason source-hostile-marker-detected, and release to staging remained disabled. This is a small deterministic safeguard, not a general malware or content-moderation claim.

Figure 6. Visible hostile-marker failure and disabled staging action for the refused source version.

Common platform context

The Gate A mesh remained available throughout the walkthrough: all twelve component instances reported ready. Gate B's Director, Presentation Gateway, synthetic identity, semantic-view and lifecycle controls were reused without a new orchestration mechanism. Gate C added real behaviour only where the source path required it.

Figure 7. Operations summary confirming all twelve shared component instances ready in the evidence environment.

Functions, rules and contracts delivered

Area	Current baseline
Workbench UX - 02	Paste/upload preview, required provenance, synthetic confirmation, status, checks and staging UI.
Source governance CNT - 01	Immutable quarantine, digest, deterministic validation, lifecycle state, idempotency and outbox.
Authorisation AUT - 01	Exact AZ - 001 decision for actor, role, purpose, action and source-version resource.
Operations OPS - 01	Correlated metadata-only success and refusal lifecycle projection.
Events INT - 01	Durable source .received, quarantined, validated, validation-refused and staged facts.
A - 001 and A - 002	Authenticated intake/quarantine followed by separately authorised staged-source release.
Security and privacy	Environment-bound synthetic reviewer; browser cannot assert protected fields; source body stays with CNT - 01.

The exact-source hosted check passed contract catalogues and fixtures, Rust formatting, linting and tests, frontend type checks and tests, architecture checks, and end-to-end smoke coverage including exact retry, changed-input idempotency refusal, hostile-marker refusal and staging refusal. The browser walkthrough added real screen and event evidence; it did not repeat unaffected Gate A or Gate B qualification.

Remaining Gate C work

Gate C is not closed by this slice. The next bounded increment is DS-03 step 7 and step 9: KN0-01 must consume the staged-source fact, record idempotent receipt, emit `processing.started`, perform only the approved basic text processing, emit a terminal outcome, and visibly reconcile after restart without a duplicate completion. Workbench, Presentation and Operations must show that lifecycle. Only then can the complete DS-03 path be walked and Gate C closure considered.

Next acceptance step	Required visible proof
Consume staged source	One KN0-01 receipt tied to the immutable source version and correlation.
Process bounded text	Queued, started and terminal states on Workbench, Presentation and Operations.
Reconcile after restart	Readiness returns and no duplicate terminal result is created.
Consider Gate C closure	Complete DS-03 path, adverse cases and final show-and-tell are walked.
