

Gate B: environment, identity and portal orchestration

Progress report, system-test record and show-and-tell

Evidence field	Recorded value
Status	Founder accepted; Gate B formally closed for publication on 1 September 2026
Walkthrough	1 September 2026, local synthetic Minikube environment
Review branch revision	dc521eeb2be517557a8083b7e336d304ce99262d
Runtime source revision	8b5c0e4089fde20a3c6a28ced9bb6d8b32399276
Runtime image	public-purpose-lab/m3-runtime:gate-b-review-exact-2
Runtime image ID	sha256:f00d90dbead3a9de58a1e63b12493b6c8a791e1a85767a2d413fe56838499434
Package	presentation-control-assurance v1.2.1
Package digest	15b78a9bfb7290eeb256e91ea61d24f404fe375e5adb2e0316023fe20b4547d4
Environment	environment-c5ef1307484826d1b598ad73a08d31b6
Cluster	public-purpose-lab-gate-a
Trust profile	Environment-local synthetic root; synthetic data only
Evidence session	session:e753a0a7-a0d3-437d-b776-4c5f29e1662f
Screen-detail pass	session:03247293-4eab-4244-9b5d-7077bf763de3
Final clean successor	session:905e83a1-a1a8-49d2-a03b-dbdbe2efb0af

This is in-development demonstrator evidence. It does not establish production, legal, regulatory, clinical or compliance assurance, and it does not transfer accountable human authority to the Lab.

Outcome

Gate B now delivers a visible, end-to-end demonstration framework rather than only abstract contracts. A presenter can inspect the environment and admitted scenario, create and control a Demonstration Session, establish a signed environment-bound synthetic reviewer, and direct semantic views on independent Presentation and Workbench surfaces. Operations shows the correlated requests, outcomes and refusals.

The Workbench visibly offers the next business path, including upload, link, paste and provenance controls. Those controls are deliberately non-submitting in Gate B. Gate C will make governed source intake the first real business process.

Acceptance summary

Approved requirement	Walkthrough evidence	Position
Environment, trust and presenter are visible	Figure 1	Achieved
Admitted scenario and honest limitations are visible	Figures 1 and 2	Achieved
Session exists before a synthetic reviewer is assigned	Figure 2 and event evidence	Achieved
Signed reviewer is environment- and session-bound	Figure 3	Achieved
Director controls an admitted running scenario	Figure 4	Achieved
Presentation owns and resolves PRES-INTRO	Figure 5 and Operations events	Achieved
Workbench owns engagement and source-intake views	Figures 6 to 8 and Operations events	Achieved
Ordinary Workbench navigation remains available	Figure 7	Achieved
Unsupported view is refused explicitly	Figure 9 and Operations view.refused	Achieved
Pause, stop, termination and reset are visible	Figures 10 to 12	Achieved
Twelve components remain deployed and observable	Figures 13 and 14; Gate A regression	Achieved
Founder acceptance and formal publication	This report and PDF	Achieved

Flow and screen evidence

1. Environment and admitted scenario

The Director makes the presenter, environment identity, runtime and synthetic trust classification visible before the scenario can run. It presents only the admitted Gate B scenario and states that changing views is not a business operation.

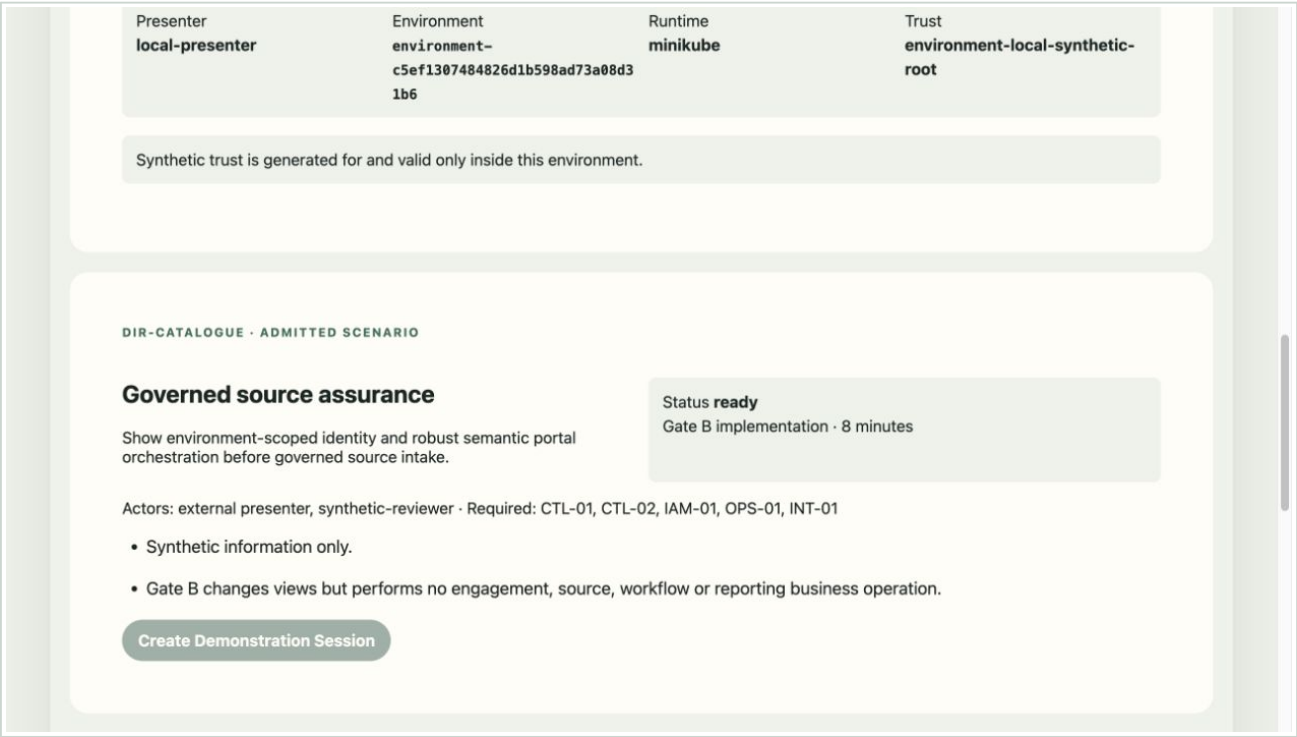

Figure 1. Director environment, environment-local synthetic trust and admitted governed-source scenario.

The prepared session is explicit, revisioned and governed by a bounded logical scenario time. Presentation and Workbench are separately opened and registered before the scenario begins.

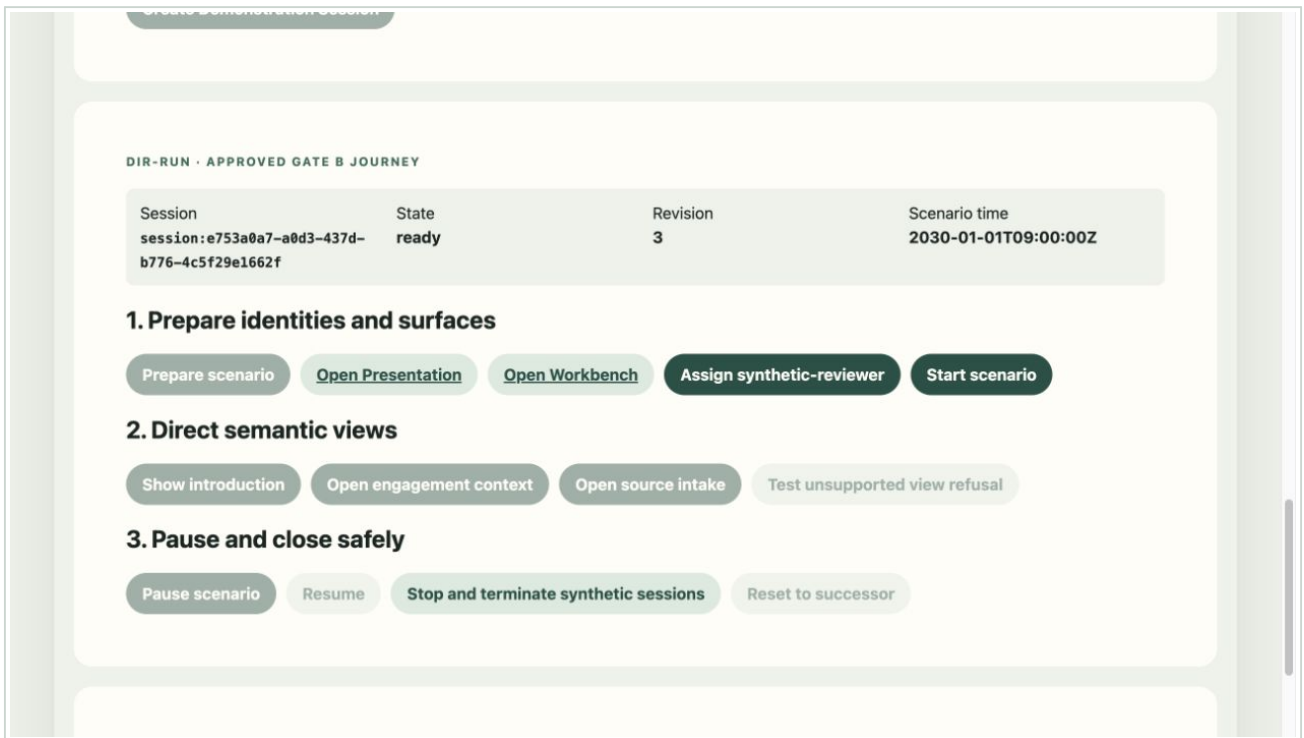

Figure 2. Prepared Demonstration Session with target-surface links and disabled run commands until preparation completes.

2. Synthetic identity without browser-held grants

The Director requests the `synthetic-reviewer` assignment through the event and identity path. Workbench receives the resulting session binding from its own backend and displays actor, role, trust, environment, Demonstration Session and expiry. The signed establishment grant is not placed in the browser.

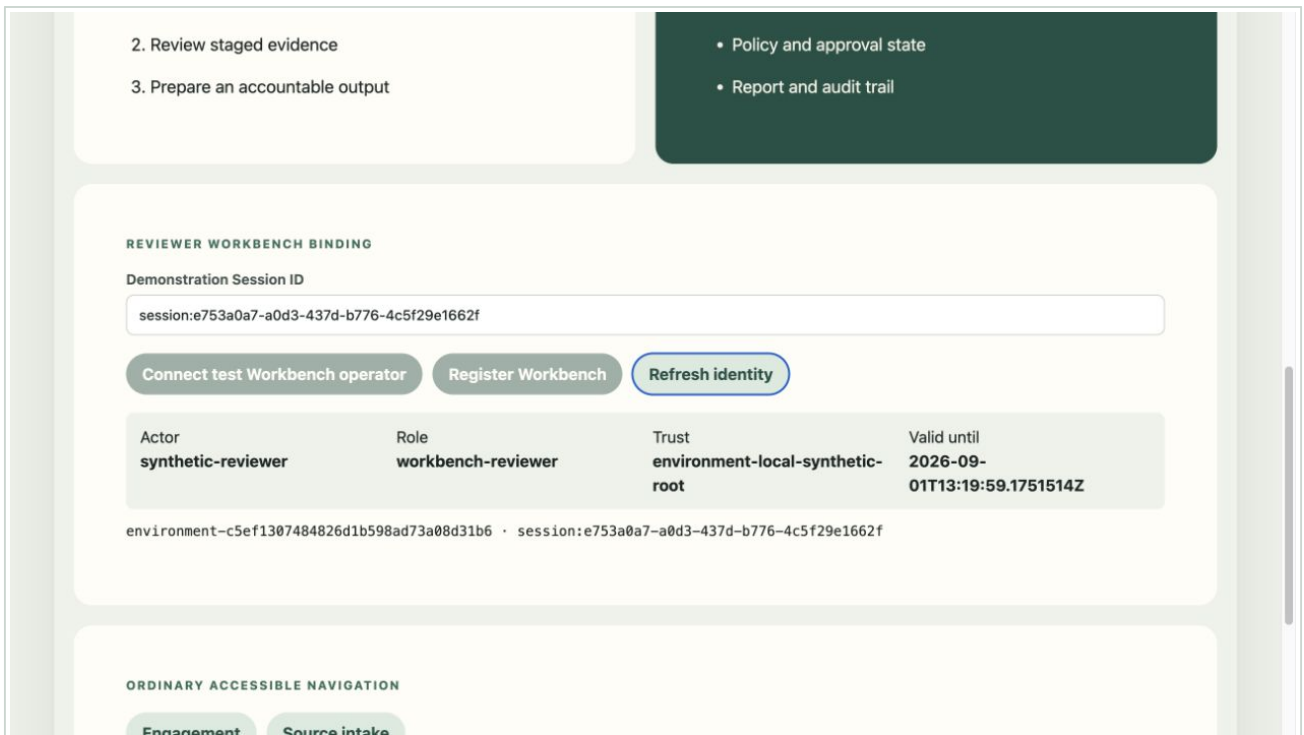

Figure 3. Workbench showing the environment- and session-bound synthetic reviewer.

3. Director-controlled semantic presentation

Starting the scenario enables only the admitted semantic-view and lifecycle commands. Surface URLs are navigation aids; the control mechanism remains versioned events and target-owned outcomes.

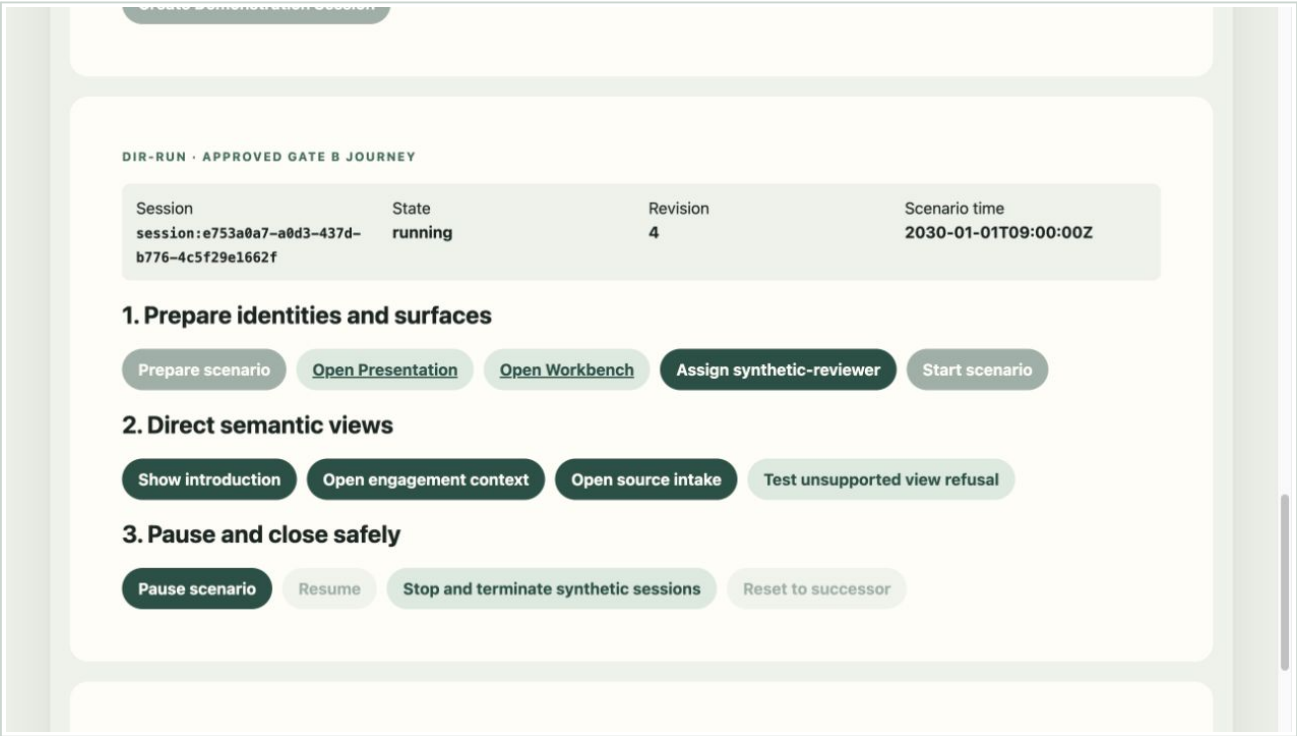

Figure 4. Running Director session with admitted view and lifecycle controls.

The Presentation surface resolves PRES-INTRO and shows purpose, actors, desired outcome, current stage and non-claims. A visible screen records presentation progress only; it does not prove attention, business completion or compliance.

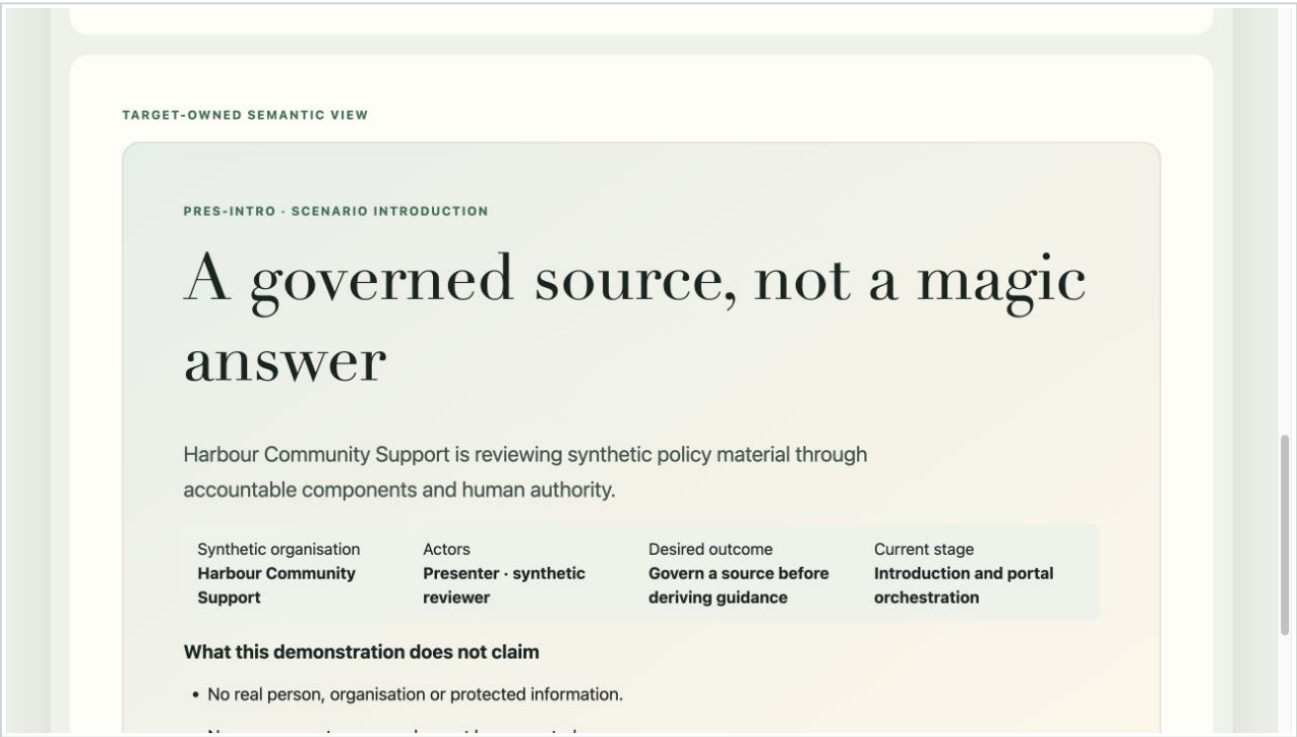

Figure 5. Audience-owned PRES-INTRO view with scope and accountability limits.

4. Workbench context and source-intake preview

The Workbench first resolves the synthetic engagement context. It keeps human review authority, synthetic classification and the fact that no engagement has been created visible.

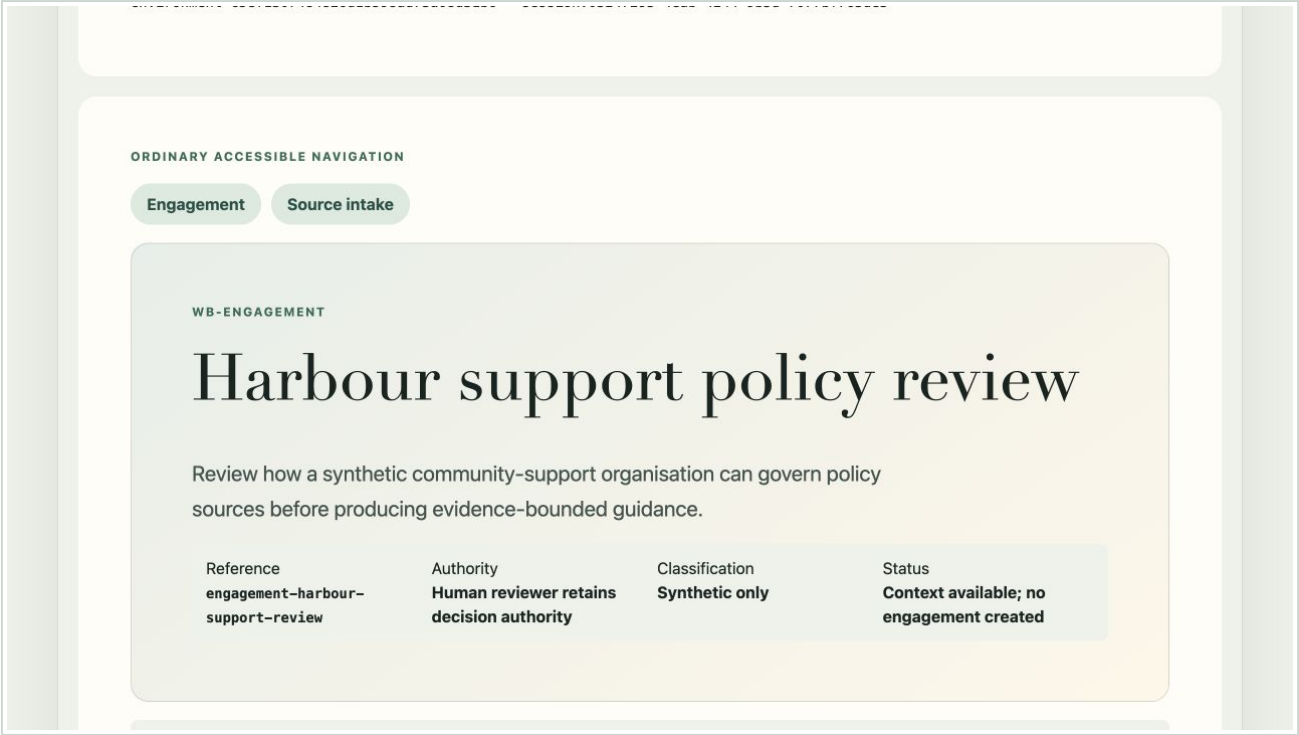

Figure 6. Workbench-owned engagement context.

The same surface can be navigated normally by a user. Ordinary navigation emits no Director business event and remains available for accessibility and productive use.

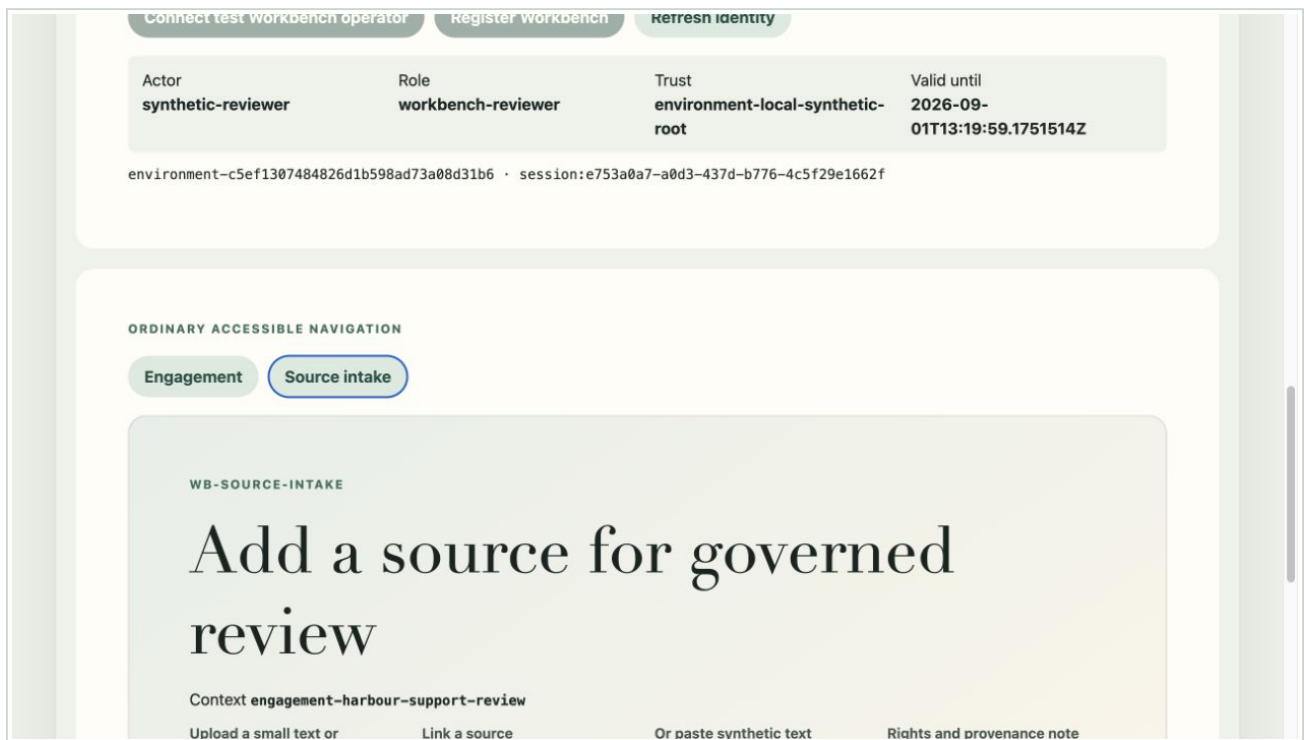

Figure 7. Manual navigation to source intake, explicitly recording that no business event was emitted.

The Director can also request the same semantic view. The target owns the screen and reports an applied view outcome. Upload, link, paste and provenance controls are present, but submission to quarantine is held for Gate C.

Figures 6 and 8 use the clean successor as a short supplementary screen-detail pass so the target-owned content is framed clearly. It ran on the same exact image and environment, then stopped and reset to the final clean successor.

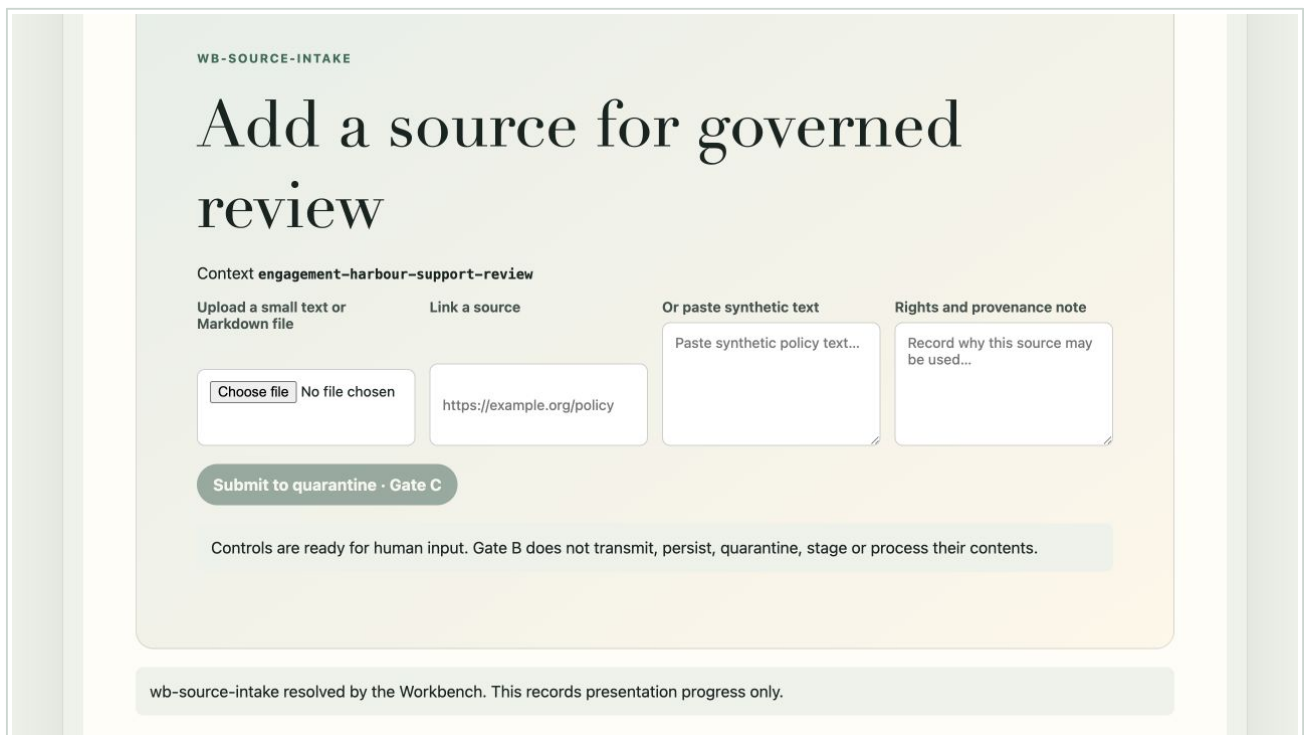

Figure 8. Director-requested source-intake view with Gate C submission disabled.

5. Refusal and lifecycle safety

An unadmitted semantic view fails visibly rather than being improvised or silently accepted. The Director reports `director-operation-refused`, the API returns HTTP 409, and Operations records `view.refused` with reason `wb-not-admitted`.

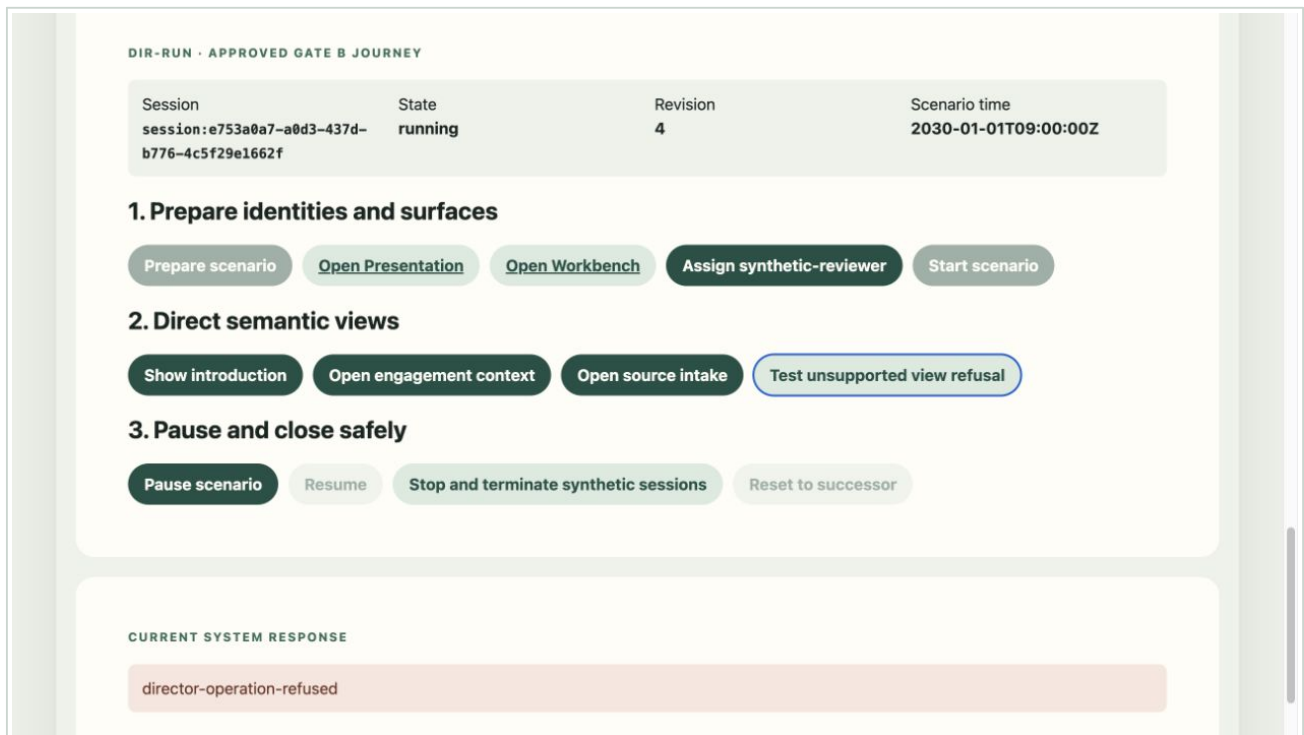

Figure 9. Explicit unsupported-view refusal in the Director.

Pause changes the revisioned scenario state and disables semantic-view commands until resume.

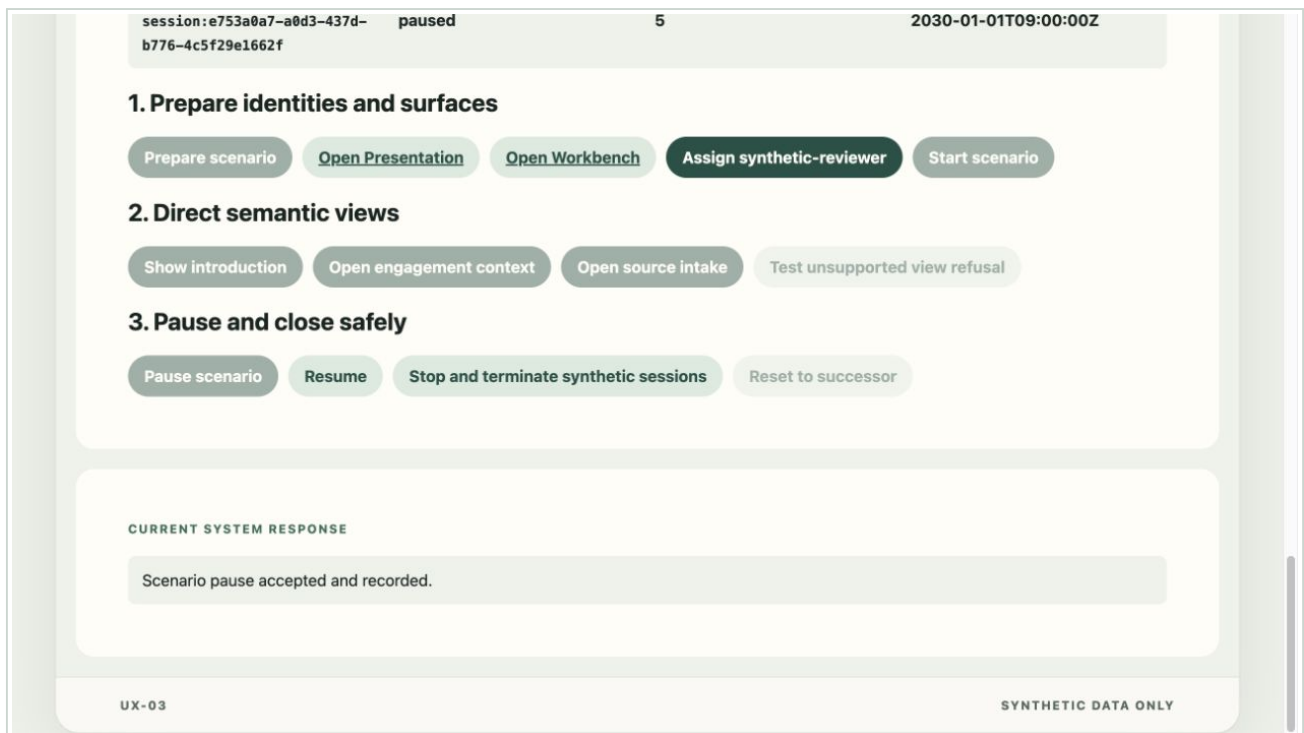

Figure 10. Director in the paused state.

Stop terminates the synthetic application binding. Refreshing Workbench then shows that no synthetic actor remains and disables navigation.

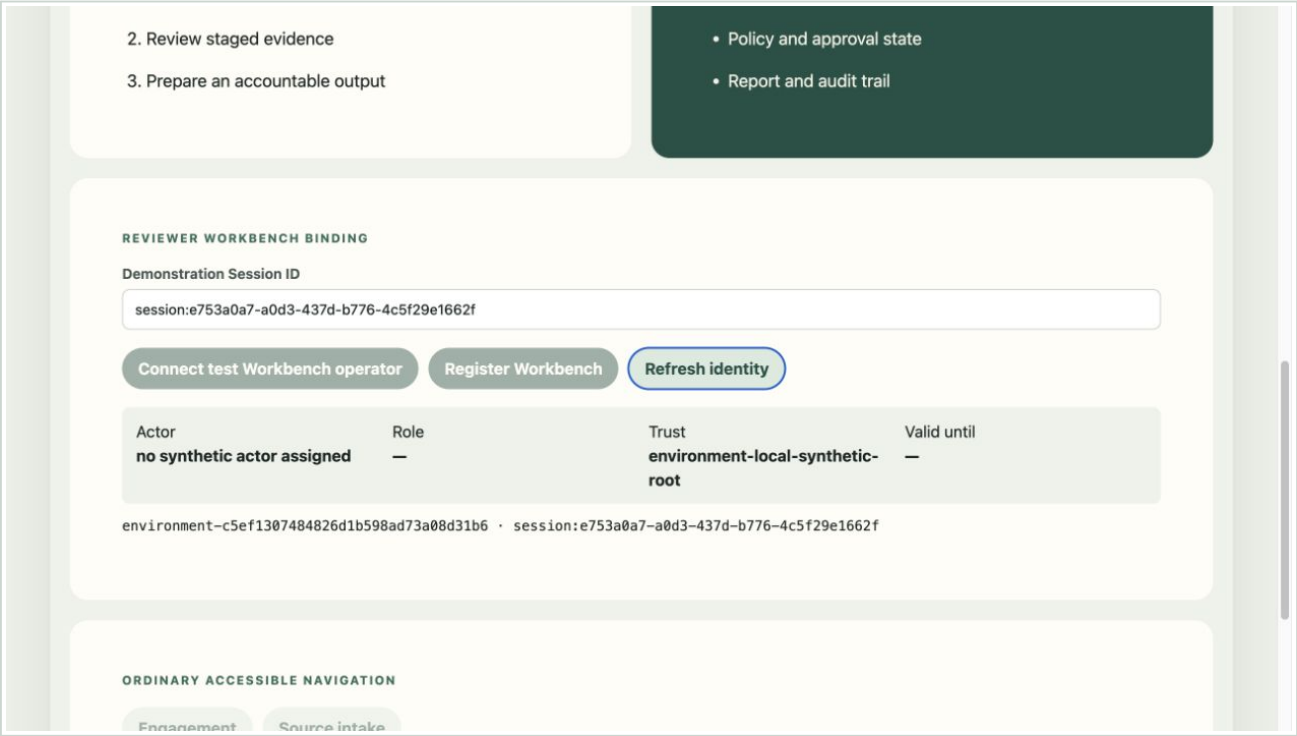

Figure 11. Workbench after synthetic-session termination.

Reset creates a clean successor rather than reusing stopped scenario state. The external presenter remains signed in, while the predecessor's synthetic bindings, checkpoint and logical-time state are not inherited.

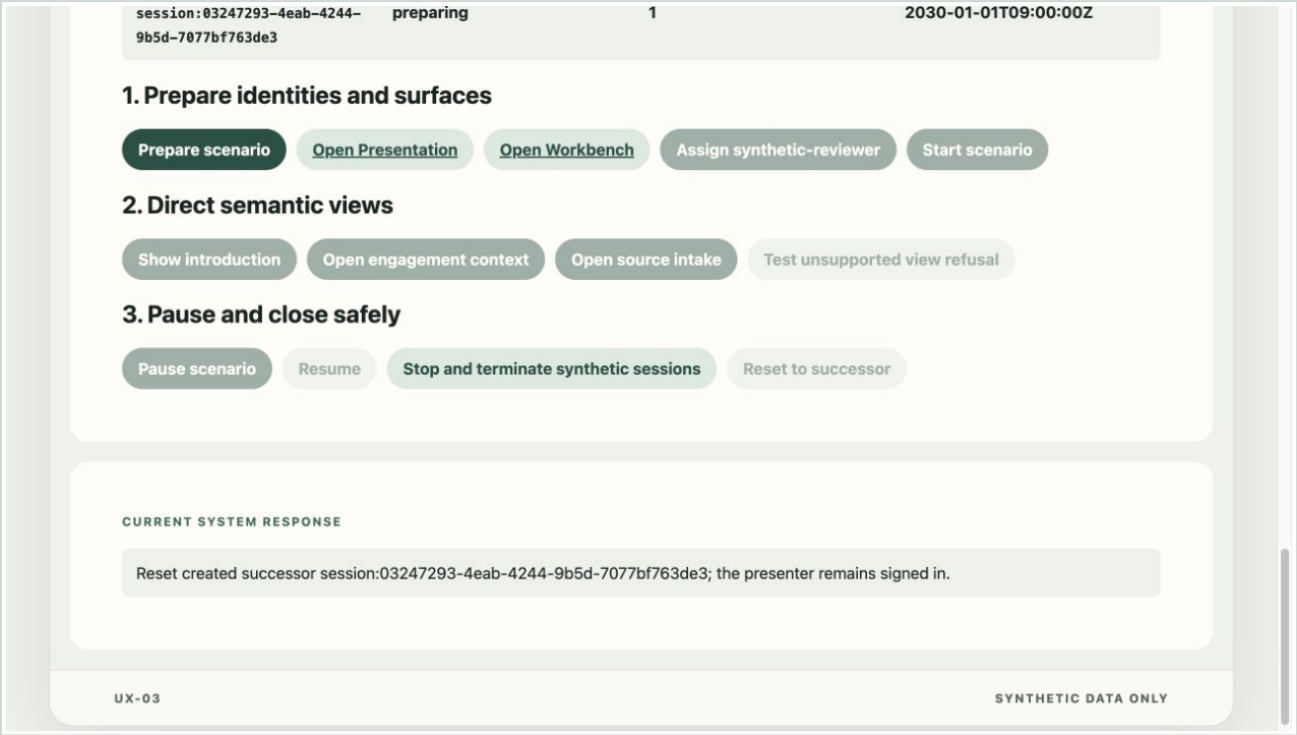

Figure 12. Clean successor session created after reset.

Operations and system-test evidence

Operations correlated the evidence session across CTL-01 and CTL-02. The live timeline captured `view.requested` and `view.applied` pairs for `pres-intro`, `wb-engagement` and `wb-source-intake`, followed by the explicit `view.refused` outcome.

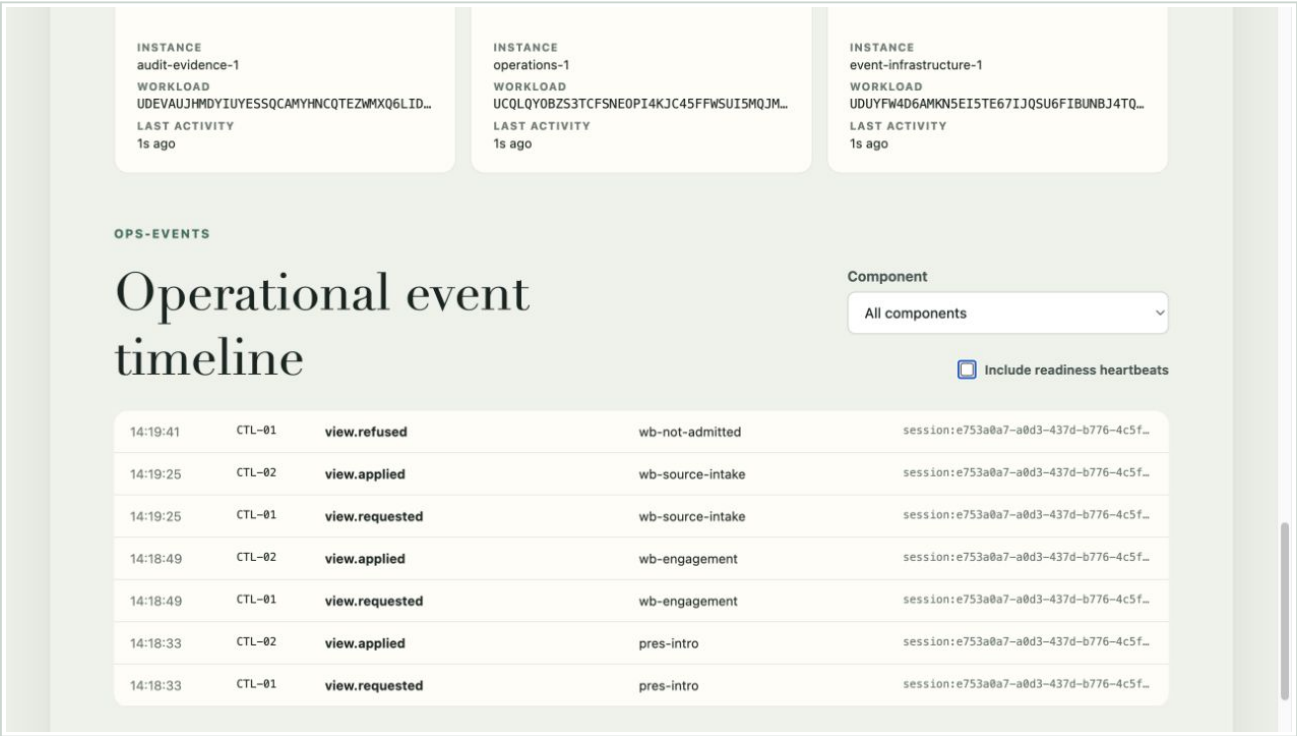

Figure 13. Correlated operational event timeline for the evidence session.

All twelve expected component instances remained ready on the exact runtime image. The screen reports distinct component, instance and workload identities; readiness expires if heartbeats stop.

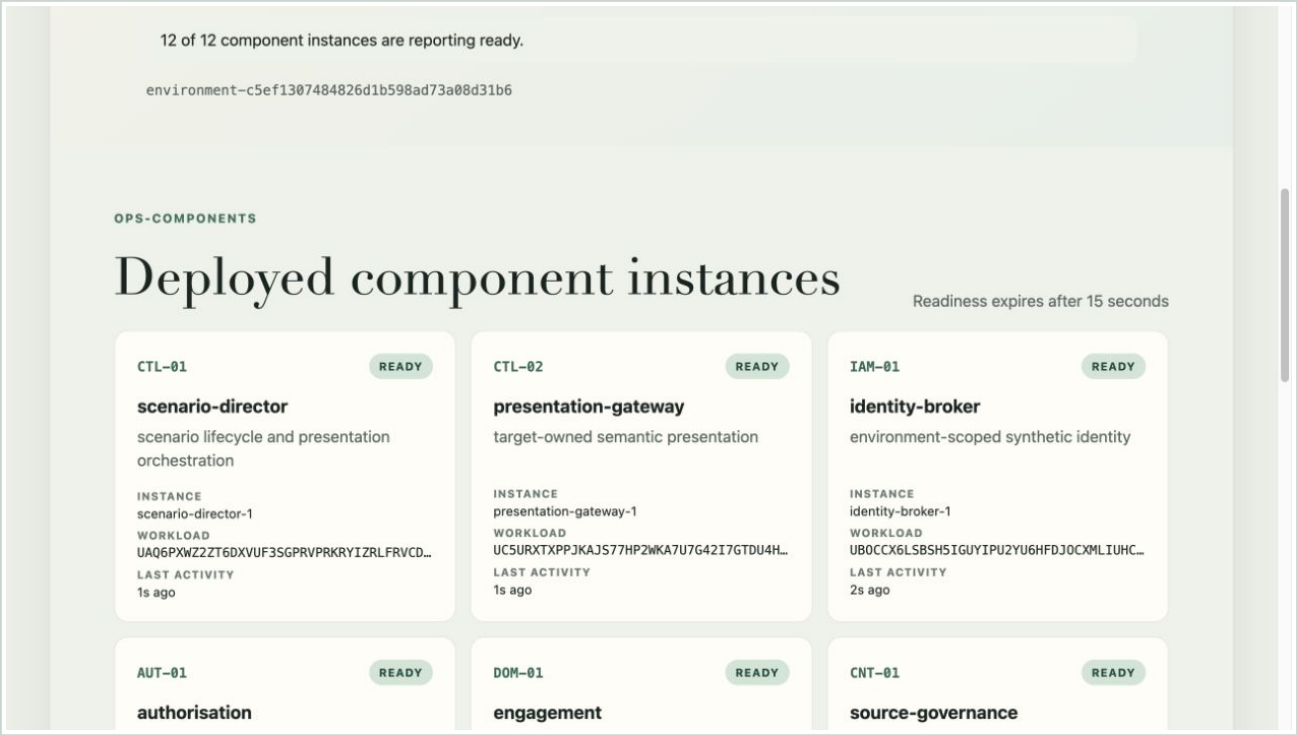

Figure 14. Operations component-mesh readiness view.

The browser walkthrough was complemented by the exact-image command-line test:

Check	Evidence
Gate B command-line walkthrough	Session session:0ef7064a-f1b4-4283-83b8-3a190dcac1cb completed the full scenario, including the unsupported-view 409, pause, stop, reset and clean successor session:1c497771-f7da-4277-b321-e58fb1f6aa17.
Gate A regression	All twelve readiness paths and nine bounded capability commands completed under correlation:65966786-7e45-4a85-9c9f-b91a664dd505.
Engineering checks	Rust formatting, clippy with warnings denied, all 61 Rust tests, web type-checks, ten web tests, architecture and contract checks passed for the runtime change. Local-link, formatting, web type-check and web-test checks passed for the final local-origin binding.

The repeated visual test exposed a real browser-session defect before this report was completed: cookies are host-scoped rather than port-scoped, so the three concurrent surfaces could overwrite each other's application sessions. The baseline now uses exact, distinct local host origins: localhost for the Director, presentation.localhost for Presentation and workbench.localhost for Workbench. The runtimes use an explicit origin allowlist with no wildcard; managed hosted profiles still reject additional origins. Fresh proof-only aliases were admitted temporarily for the repeated capture pass and removed afterwards so retained browser cookies could not influence the evidence.

Functions, rules and component responsibilities delivered

Area	Gate B baseline
CTL-01 Director	Environment and catalogue evaluation; revisioned create, prepare, start, pause, resume, stop and reset; admitted semantic-view commands; explicit refusal
CTL-02 Presentation Gateway	Role-specific surface registration; backend cue delivery; target-owned applied, unsupported and expired outcomes; synthetic-session termination
IAM-01 integration	Signed environment- and session-bound synthetic reviewer establishment; expiry and revocation; no browser-held establishment grant
Director UI	Functional demonstration controls and links to Presentation, Workbench and Operations
Presentation UI	Audience-owned introduction and progress views with visible non-claims
Workbench UI	Reviewer identity banner, engagement context, source-intake preview and ordinary accessible navigation
Operations UI	Twelve-component readiness and correlated lifecycle, identity, request, outcome and refusal events
Event and contract rules	Explicit command, correlation, causation, idempotency, revision, connection generation, operational expiry and conclusive outcome boundaries

DOM-01, CNT-01, KNO-01, WRK-01, RPT-01 and AUD-01 remain deployed walking skeletons at this gate. Gate B does not claim that they perform engagement, source governance, knowledge processing, workflow, reporting or durable audit functions.

Next gate

Gate C is authorised to implement DS-03 as the first functional business path:

Step	DS-03 next requirement
1	Accept a small synthetic upload, pasted text or permitted link.
2	Quarantine it before any extraction or indexing.
3	Record provenance, rights, digest, policy and validation state.
4	Show processing progress, logs and correlated events.
5	Stage the accepted source for later governed retrieval.
6	Produce the next visually verified show-and-tell report and PDF.

Gate C should reuse the Gate B Director, identity, surface, event and Operations contracts, changing them only where the real source-intake process produces specific evidence that the baseline needs revision.
